Hiring Manager
Intelligence and Space Research Division
Los Alamos National Laboratory
Los Alamos, NM, US

Subject: Application for the Intelligence and Space Research Division Undergraduate Internship

Dear Hiring Manager,

The Intelligence and Space Research (ISR) Division Undergraduate Internship at Los Alamos National Laboratory has my full attention for application. My enrollment at the University of Alabama Honors College as an Aerospace Engineering student perfectly matches ISR's mission to develop advanced remote sensing technologies through design and testing activities because I share a strong interest in both space systems and computational modeling and hands-on engineering work. The position offers me an ideal chance to unite my academic knowledge with technical skills and future professional goals.

I was always intrigued by problem-solving challenges starting from my early years when I restored jet skis entirely by myself followed by starting my equipment rental business and creating software-driven engineering solutions. Through practical work in system design and programming together with mechanical engineering I have developed a wide range of abilities that go past standard academic learning. My strengths emerge in multidisciplinary settings that unite innovation with practical implementation through my work on GSM-based IoT communication and automated Docker server optimization and vehicle control system engineering using assorted microcontrollers such as Arduinos and SIM7000A.

My academic performance at the University of Alabama has produced a 3.79 major GPA while taking courses such as Aerodynamics, Computational Methods, and System Design to develop my skills in aerospace system analysis. My strong proficiency with Python, MATLAB, SolidWorks, and circuit design provides me with valuable tools to develop space hardware, process signals, and create flight software. My skills match the requirements of ISR-5 (Space Instrument Realization) and ISR-3 (Space Data Science and Systems) because these groups integrate aerospace mechanics with software integration and space-based instrumentation.

The responsibilities of Class President and Sports Chair for Pi Kappa Alpha Fraternity provided me with essential experience to work in demanding situations and oversee significant tasks and direct multiple kinds of teams. My work experiences in construction and engineering sectors at Wilson & Company as well as during my internship have strengthened my capability to solve problems and adapt in real-world construction sites.

The LANL internship exceeds basic opportunity status because it provides me with ideal conditions to use my engineering abilities while enhancing my technical skills and supporting vital space research. I seek knowledge from field experts as I enter an innovative environment to work on challenging projects at ISR. Your review of this application is greatly appreciated. I am excited about the chance to demonstrate how my abilities and practical background matches the goals of the ISR Division at LANL.

Best regards,
Keelan O’Doherty
